

# USER GUIDE

We have made a database for an online shopping platform which can be used by a customer to purchase goods.

1. **Signup**- A new customer can signup to the app by giving his/her details and make a login account for themselves.
2. **Login** - Existing customers can login into their account and use the features of our app like-

View available products will display all the available products which a customer can buy.

Customers will have the option to add products to buy into their cart.

Customers will also have the option to remove products from the cart.

Finally the customers can place their order and logout from the account.

The customer have to pay with cash after their order is delivered.

3. **Admin** - The admin is a person who has access to all the accounts in the database.

Admin can also manage the inventory (add/remove goods)of the products which are available for the customers to add to their cart.

Admin will be able to all the pending and previous orders for every customer and can update the order status.

That was some of the features we have worked on.

We have made this easily usable application which can be used by an online store to manage their goods.
